

Instruction of Dymista Nasal Spray

1. Blow your nose to clear it before using the nasal spray.
2. Shake the bottle well, remove the clear plastic dust cap, and for the first use, spray into the air several times until a mist appears.
3. Tilt your head slightly forward and exhale gently.
4. Hold the spray bottle with one hand, use your index finger to close one nostril, and insert the spray nozzle into the other nostril.
5. Inhale slowly through your nose while pressing the spray bottle to release one dose of mist.
6. Repeat the same steps to administer the medication to the other nostril. If each nostril requires two doses, repeat all steps once more from **Step 2**.
7. After using the spray, avoid blowing your nose immediately. Wipe the nozzle with a clean tissue and tightly replace the clear plastic dust cap.

*Each nasal spray contains enough medication for 120 sprays. Do not use the spray beyond 120 doses, as it may not deliver the correct amount of medication afterward. Keep track of your usage, and even if there is still medication in the bottle, discard it when you reach the limit. (Do not count the initial empty sprays for preparation before the first use.)
